

06 - How To Build Your Facebook Pixel And Event Conversions

S1: Hello there, in this module, I will be walking you through on how to build your Facebook Pixel and Event Conversions.

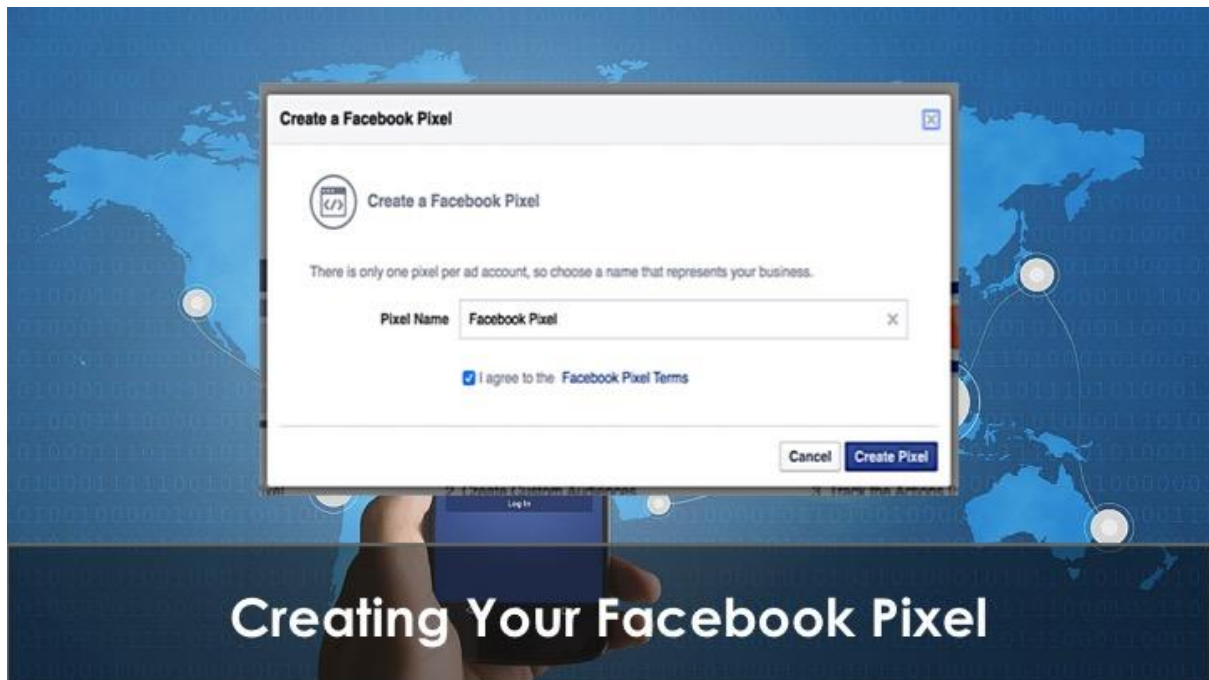

S2: Facebook Pixel combines the functionality of the Facebook Conversion Pixel and the Custom Audience pixel into a single pixel.

Through that combination, you can now build your audiences with Facebook Pixel instead of relying on conversion pixel and Custom Audience pixel. If you are still utilizing these 2 features, it is recommended to upgrade to Facebook Pixel.

S3: To create your Facebook Pixel, click on your Ad Account in your Business Manager. Next, click on Tools from the top menu and from the drop-down menu, select Pixels.

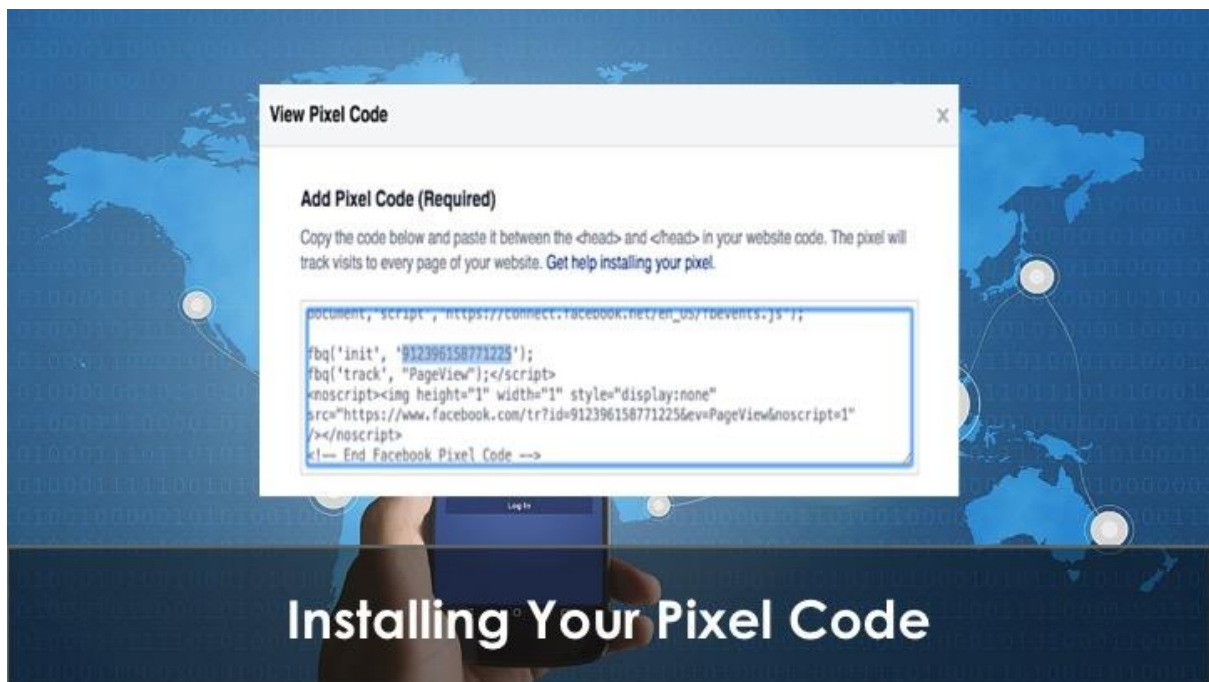

On the next page, make sure your Facebook Pixel has been selected on the top left and then click on Create a Pixel button located at the middle column.

S4: Next, you will be prompted to name your pixel. Choose a name that represents the business because you are only allowed to have one pixel per ad account.

If you are advertising for more than a single website, it is best to create a new ad account for each website to ensure that the data gathered is accurate.

Once you have named your ad account, click on Create Pixel button.

By naming your pixel code, you don't have to track back to your pixel code and instead, copy paste from the text file.

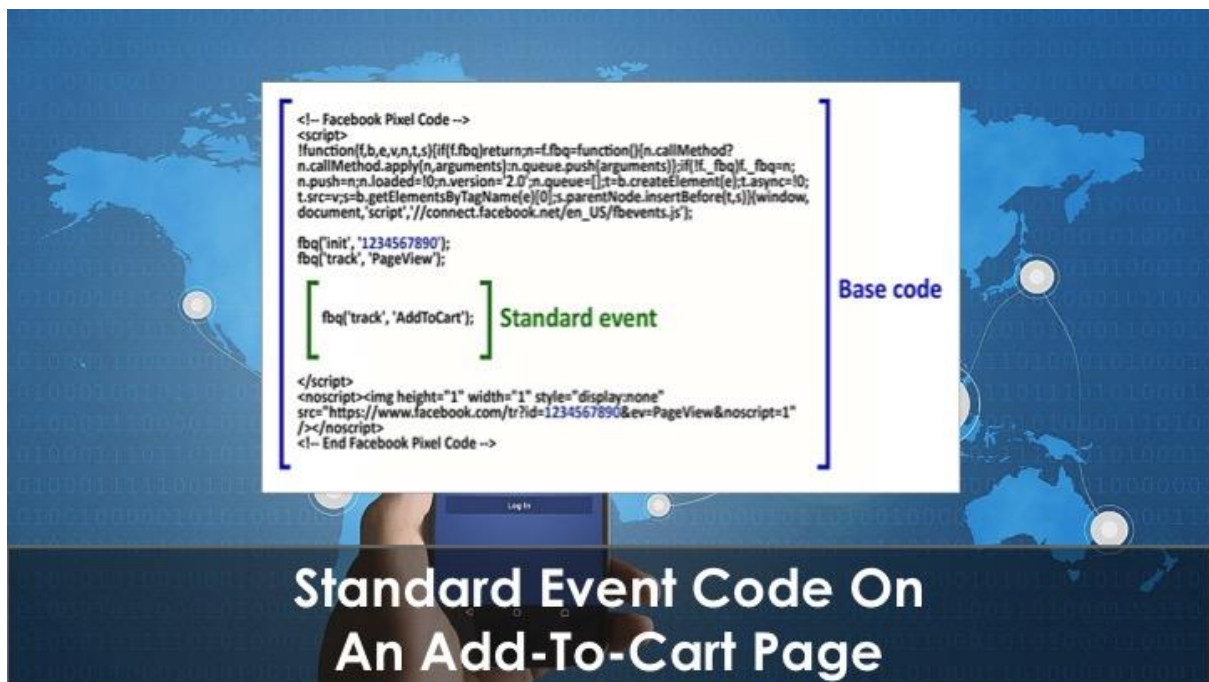

Click Save. Once the code is created, check out the Facebook Pixel Helper to ensure that the code is working properly.

S6: Next is to install the Facebook Pixel, if you are not familiar with coding, there are various plug-ins for installing Facebook Pixels on the website.

To install the code, open up the code editor to the page you want to track, look between the head tags near the top of the page and paste the Facebook Pixel code right here.

If you have existing code between the head tags, place the pixel code underneath it but above the head.

S7: Next, your Facebook pixel code will appear like the diagram above, except that your pixel ID will be different from the 10 digit code example.

Lastly, in your Facebook pixel code, above the closing script tag, paste the standard event code that is relevant to your page, for example, Add To Cart button.

It is necessary to go through this process for every page if you want to track your Add To Cart as an example.

S8: There are various standard event codes available in Facebook Pixel for you to track and each event code represents a specific action.

Event codes allow you to see the total number of audience that goes through your funnel and the list of actions that they take.

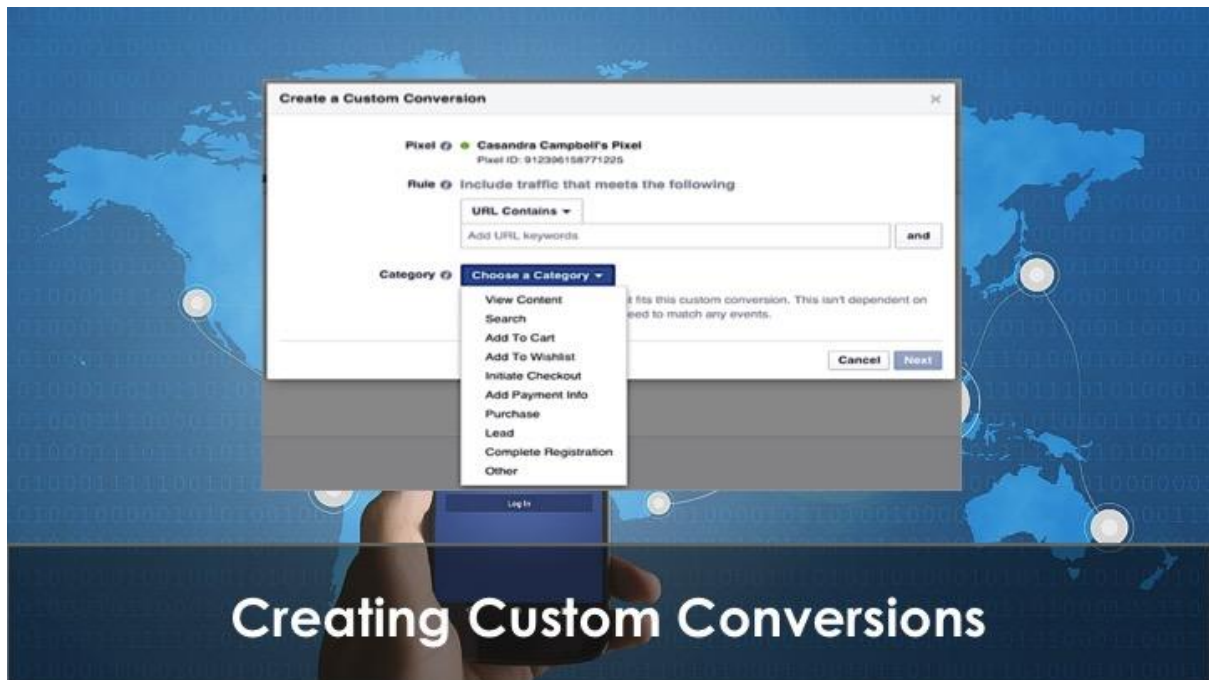

From each action, you could determine if people are adding products to cart or even adding payment info.

What if people are viewing your content but they are not making a purchase?

Through these codes, you can pinpoint which stage requires adjustment to get the action steps to flow from viewing products to making a purchase.

In Facebook Pixel, website custom audience is how Facebook helps you retarget website visitors. This part has been covered in Module 5 on how to target and retarget audience.

Besides creating custom audiences, you can create custom conversions as well by selected a completion page and renaming the conversion. Do note that the completion page is your thank you page.

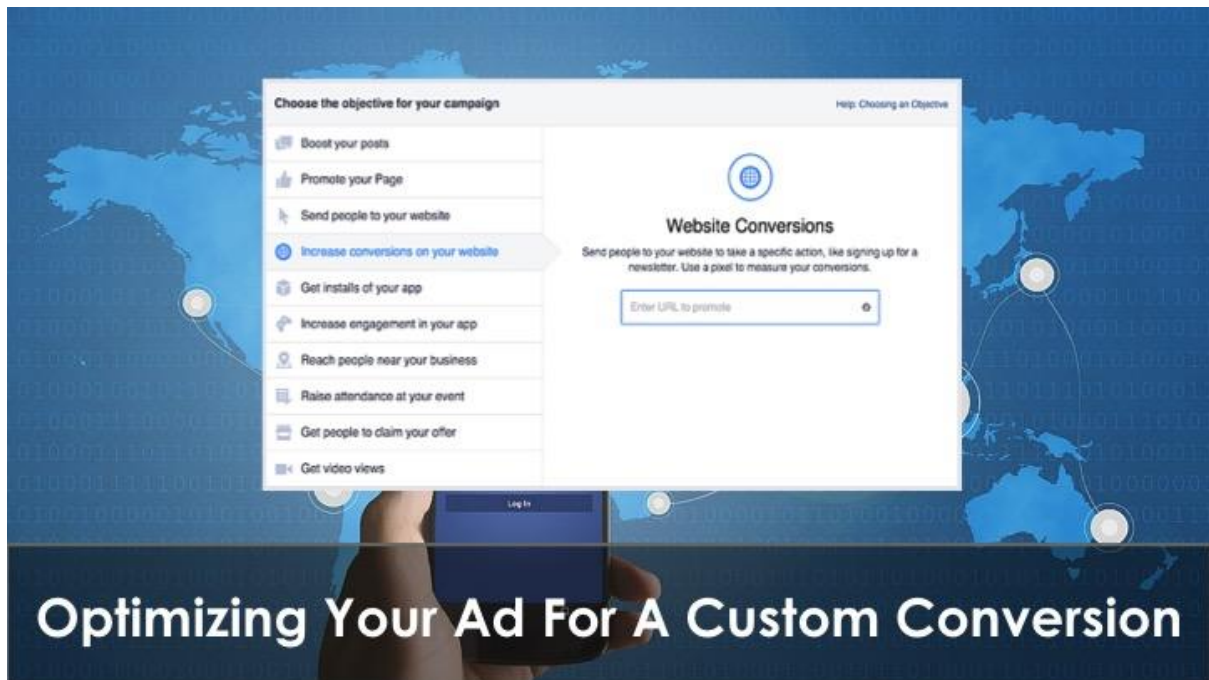

Creating Custom Conversions

S9: With Custom Conversion you can pick the type of conversion, such as “Purchase” and add a monetary value.

Take for example, if I create a Custom Conversion that tracks visitors to a product download page, I can include the price of the product. This feature will assist me with figuring out if my ad campaigns are profitable.

Let’s say I charge \$35 for my product, but I am spending \$40 for every purchase that comes from Facebook ads, I am making a loss in advertising as my advertising expenditure is higher than my revenue and profit margin therefore I would need to make adjustments to my Facebook ad.

S10: The best part about Custom Conversion is that once it is created, it will be tracked for all my ads, whether I decide to optimize for it or not.

Your Customer Conversions are constantly being tracked and you can create a report for every single ad that displays the conversion rate for any of your Custom Conversions.

And that marks the end of this module.

In summary, with Facebook Pixel and Event Conversions, you can easily track your audience interaction with your ads and optimize the actions taken to increase conversions.
